

## Digraphs

9/2/2002 3:16 AM      Digraphs      1

## Outline and Reading

- ◆ Digraphs
- ◆ Traversals of digraphs (§6.4.1)
- ◆ Transitive closure (§6.4.2)
- ◆ Floyd-Warshall's algorithm (§6.4.2)
- ◆ Directed acyclic graphs (§6.4.3)
- ◆ Topological ordering (§6.4.3)

9/2/2002 3:16 AM      Digraphs      2

## Digraphs

- ◆ A digraph is a directed graph whose edges are all directed
- ◆ Applications
  - one-way streets
  - flights
  - task scheduling

9/2/2002 3:16 AM      Digraphs      3

## Directed DFS

- ◆ We can specialize the traversal algorithms (DFS and BFS) to digraphs by traversing edges only along their direction
- ◆ In the directed DFS algorithm, we have four types of edges
  - discovery edges
  - back edges
  - forward edges
  - cross edges
- ◆ A directed DFS starting at a vertex  $s$  determines the vertices reachable from  $s$

9/2/2002 3:16 AM      Digraphs      4

## Transitive Closure

- ◆ Given a digraph  $G$ , the transitive closure of  $G$  is the digraph  $G^*$  such that
  - $G^*$  has the same vertices as  $G$
  - if  $G$  has a directed path from  $u$  to  $v$  ( $u \neq v$ ),  $G^*$  has a directed edge from  $u$  to  $v$
- ◆ The transitive closure provides reachability information about a digraph
- ◆ We can compute the transitive closure in time  $O(n(n+m))$  by repeated applications of directed DFS

9/2/2002 3:16 AM      Digraphs      5

## Floyd-Warshall's Algorithm

- ◆ Floyd-Warshall's algorithm numbers the vertices of a digraph  $G$  as  $v_1, \dots, v_n$  and computes a series of digraphs  $G_0, \dots, G_n$ 
  - $G_0 = G$
  - $G_k$  has a directed edge  $(v_i, v_j)$  if  $G$  has a directed path from  $v_i$  to  $v_j$  with intermediate vertices in the set  $\{v_1, \dots, v_k\}$
- ◆ We have that  $G_n = G^*$
- ◆ In phase  $k$ , digraph  $G_k$  is computed from  $G_{k-1}$

**Algorithm FloydWarshall(G)**  
**Input** digraph  $G$   
**Output** transitive closure  $G^*$  of  $G$

```

i ← 1
for all v ∈ G.vertices()
    denote v as v_i
    i ← i + 1
G_0 ← G
for k ← 1 to n do
    G_k ← G_{k-1}
    for i ← 1 to n (i ≠ k) do
        for j ← 1 to n (j ≠ i, k) do
            if G_{k-1}.areAdjacent(v_i, v_k) ∧
               G_{k-1}.areAdjacent(v_k, v_j)
                if ¬G_{k-1}.areAdjacent(v_i, v_j)
                    G_k.insertDirectedEdge(v_i, v_j, k)
return G_n
                    
```

9/2/2002 3:16 AM      Digraphs      6

### Example

$G = G_0 = G_1 = G_2$

$G_3$

$G_4 = G_5 = G^*$

9/2/2002 3:16 AM      Digraphs      7

### DAGs and Topological Ordering

- A directed acyclic graph (DAG) is a digraph that has no directed cycles
- A topological ordering of a digraph is a numbering  $v_1, \dots, v_n$  of the vertices such that for every edge  $(v_i, v_j)$ , we have  $i < j$
- Example: in a task scheduling digraph, a topological ordering is a task sequence that satisfies the precedence constraints

**Theorem**  
A digraph admits a topological ordering if and only if it is a DAG

DAG  $G$

Topological ordering of  $G$
